Welcome to this CoGrammar Q&A:

Django Foundations

The session will start shortly...

Questions? Drop them in the chat.

Software Engineering Session Housekeeping

- The use of disrespectful language is prohibited in the questions, this is a supportive, learning environment for all - please engage accordingly.
 (Fundamental British Values: Mutual Respect and Tolerance)
- No question is daft or silly ask them!
- There are **Q&A sessions** throughout this session, should you wish to ask any follow-up questions.
- If you have any questions outside of this lecture, or that are not answered during this lecture, please do submit these for upcoming Academic Sessions. You can submit these questions here: <u>Questions</u>

Software Engineering Session Housekeeping cont.

- For all non-academic questions, please submit a query: www.hyperiondev.com/support
- Report a safeguarding incident: www.hyperiondev.com/safeguardreporting
- We would love your **feedback** on lectures: <u>Feedback on Lectures</u>

Enhancing Accessibility: Activate Browser Captions

Why Enable Browser Captions?

- Captions provide real-time text for spoken content, ensuring inclusivity.
- Ideal for individuals in noisy or quiet environments or for those with hearing impairments.

How to Activate Captions:

- YouTube or Video Players:
 - Look for the CC (Closed Captions) icon and click to enable.
- 2. Browser Settings:
 - Google Chrome: Go to Settings > Accessibility > Live Captions and toggle ON.
 - Edge: Enable captions in Settings > Accessibility.

Safeguarding & Welfare

We are committed to all our students and staff feeling safe and happy; we want to make sure there is always someone you can turn to if you are worried about anything.

If you are feeling upset or unsafe, are worried about a friend, student or family member, or you feel like something isn't right, speak to our safeguarding team:

Ian Wyles Designated Safeguarding Lead

Simone Botes

Nurhaan Snyman

Rafig Manan

:Learning Outcomes

- Define what a web framework is.
- Describe Django
- Explain the benefits of Django
- Describe the MVT structure of Django
- Explain what a model is in Django.
- Explain what a view is in Django.
- Explain what a template is in Django.
- Create templates for your Django project.

Learning Outcomes

- Implement template partials
- Implement base.html with template styling
- Prepare requirements.txt file on project completion

What is a Web Framework?

- A web framework is a collection of tools, libraries, and best practices designed to simplify the process of building and maintaining web applications.
- A web framework allows developers to focus on writing application-specific code rather than reinventing the wheel for every new project.
- Promotes code reuse.

What is Django?

- High-level, open-source web framework for Python.
- Used for developing secure and scalable web applications.

Why use Django?

- Designed to help developers take applications from concept to completion as quickly as possible.
- Architecture is highly scalable, allowing it to handle large amounts of traffic and data efficiently.
- Includes numerous security features out of the box, which help developers protect their applications from common vulnerabilities.

Why use Django?

- ORM allows developers to interact with the database using Python code instead of SQL.
- Django's templating engine allows developers to create dynamic HTML pages.

Model-View-Template (MVT) Architecture

- Variation of Model-View-controller architecture
- Three main components
 - Model: Represents the business logic and data structure of the application.
 - View: Handles the interaction between the user and the application, managing the presentation logic.
 - Template: Deals with the presentation layer, defining the structure and appearance of the HTML content.

Models

- Models serve as the blueprint for your database schema.
- Each model is a Python class/table that subclasses django.db.models.Model, and its attributes represent the fields/columns of the database table.
- Models are crucial for defining the structure of your data, including field types, default values, and validation rules.

Views

- Views handle the logic of processing user requests and returning responses.
- Views define the behaviour of our URL patterns.
- Views are Python functions or class methods, that takes a web request and returns a web response.
- They interact with models to retrieve or update data.

Templates

- Templates define the structure and layout of the HTML pages.
- Templates can incorporate dynamic data, using placeholders and template tags.
- Templates receive data from views through context dictionaries.
- Templates are stored in the templates directory.

- Project and Application Names:
 - Use lowercase letters and underscores to separate words.
 - Hyphens are not recommended because they can cause issues in import statements.
 - Choose a name that clearly describes the purpose of the project.

Model Names:

- Models are represented as classes and should use the PascalCase or also known as CamelCase.
- Model names should generally be singular, as each instance of the model represents a single record in the database.
- o Example: UserProfile

View Names:

- o For Function-Based Views, use lowercase with underscores to separate words.
- Function names should clearly describe the action or response of the view.
- o For Class-Based Views (Where methods are used), use PascalCase for class names, and the class name should describe what the view does or what it represents.
- Examples: def register_user(request): for user registration, class ProductListView(ListView): for listing products.

Template Names:

- Use lowercase letters with underscores to separate words.
- Template names should be descriptive of the view they are associated with.
- o Example: blog_detail.html, user_profile.html.
- o Organise templates into directories that mirror your application's structure.
- Create reusable template components (partials) and place them in a partials or includes directory, ie. header.html, footer.html

Let's get coding!

Let's take a short break

Final Assessment

- Refer to the polls section to vote for you option.
- 1. Which file contains the main database settings in Django?
 - a) models.py
 - b) settings.py
 - c) urls.py
 - d) views.py

- Refer to the polls section to vote for you option.
- 2. What is the default port when running python manage.py runserver?
 - a) 5000
 - b) 8080
 - c) 8000
 - d) 3000

- Refer to the polls section to vote for you option.
- 3. Which of these is NOT a valid Django field type?
 - a) CharField
 - b) TextField
 - c) DateTimeField
 - d) ImageTypeField

- Refer to the polls section to vote for you option.
- 4. Which Django template tag is used for looping?
 - a) {% loop %}
 - b) {% iterate %}
 - c) {% for %}
 - d) {% while %}

Django Recap

- Web Framework
- Django
- Models
- Views
- Templates

Questions and Answers

Thank you for attending
